What if a conductor is unbalanced?

There can be no charge within the bulk of the conductor or else there would be an electric field in the conductor and there can't be an electric field in the conductor or else the conductor's free-to-move charge would move and static conditions would not be prevailing. So, all the unbalanced charge must be on the surface.

What if electric field is zero at all points inside a conductor?

So far, in answer to the question, we have: The electric field is zero at all points inside the conductor, and, while the total charge is still zero, the charge has been redistributed as in the following diagram: Recall that we were also called upon to describe the electric field at the surface of the conductor.

What is a total electric field?

The total electric field at any point in the conductor is the vector sum of the original electric field and the electric field due to the redistributed charged particles. Since they are oppositely directed, the two contributions to the electric field inside the conductor tend to cancel each other.

What is a positive charge distribution in an initial-uniform electric field?

In the initially-uniform electric field case, the positive charge distribution was the mirror image of the negative charge distribution. Next Question: 3) Suppose you put some charge on an initially-neutral, solid, perfectly-conducting sphere (where the sphere is not in a pre-existing electric field).

What is the electric field at all points inside a spherical shell?

In particular, the electric field at all points inside an empty hollow perfectly-conducting spherical shell is, under all conditions, zero. Last question: 5) How would your answers to questions 1-4 change if the conductor had some shape other than spherical?

How does the electric field affect a conductor?

We put a solid, ideal conductor in it. The electric field permeates everything, including the conductor. The charged particles in the conductor respond to the force exerted on them by the electric field. (The force causes acceleration, the acceleration of particles that are initially at rest causes them to acquire some velocity.)
