

How is breakeven cost of storage calculated?

Breakeven cost of storage is firstly calculated with different loan periods. The time-varying mismatch between electricity supply and demand is a growing challenge for the electricity market. This difference will be exacerbated with the fast-growing renewable energy penetration to the grid, due to its inherent volatility.

Can arbitrage characteristics and breakeven costs guide energy storage system development?

The results indicate that the arbitrage characteristics and breakeven costs can be used to guide the choice of energy storage system development (capacity, effectiveness, and cost) and to determine the constraints and potential economic benefits for stakeholders who are considering investing in energy storage systems.

How does energy storage cost affect arbitrage revenue?

As shown by the three curves, when the loan period is more extended from 5 years to 20 years, the revenue is increased, which allows for a higher breakeven cost of capacity cost of the energy storage plant. However, when efficiency drops, this decreases arbitrage revenue such that the breakeven capacity cost also decreases.

How can energy storage technologies be analyzed for maximum profitability?

Based on the above arbitrage revenue and capacity costs, the potential selections of energy storage technologies can be analyzed in more detail for maximum profitability once breakeven costs are achieved via attainment of technology readiness and/or system cost reductions.

How does efficiency affect breakeven energy arbitrage?

However, when efficiency drops, this decreases arbitrage revenue such that the breakeven capacity cost also decreases. Notably, capacity cost plays a more important role than roundtrip efficiency for the breakeven energy arbitrage.

Are battery electricity storage systems a good investment?

This study shows that battery electricity storage systems offer enormous deployment and cost-reduction potential. By 2030, total installed costs could fall between 50% and 60% (and battery cell costs by even more), driven by optimisation of manufacturing facilities, combined with better combinations and reduced use of materials.
