Can cryptocurrency mining be used as a virtual energy storage solution?

One emerging concept is the use of cryptocurrency mining as a virtual energy storage solution. Hajiaghapour-Moghimi (2024) introduced Cryptocurrency Energy Storage Systems (CESSs), which act as virtual storage for microgrids, significantly reducing operational costs and nearly eliminating renewable energy curtailment.

What is virtual energy storage?

The concept of virtual energy storage proposed here is based on the surplus of necessary energy that is required to restore the system frequency to within a safe range of the nominal frequency. In a dynamic sense, virtual energy storage is very responsive and is not limited by the operation time and capacity.

Is a virtual power plant a viable energy management platform?

The virtual power plant (VPP) emerges as a promising paradigm for managing DERs to participate in the power system. In this paper, we develop a blockchain-based VPP energy management platform to facilitate a rich set of transactive energy activities among residential users with renewables, energy storage, and flexible loads in a VPP.

What is grid-scale virtual energy storage?

This article presents a novel method called "grid-scale virtual energy storage" that harvests free energy storage from properties inherent to control of multiarea power systems, thereby increasing the amount of renewable generation that a system can tolerate before its frequency stability is compromised.

What is a blockchain-based virtual power plant energy management platform?

This paper developed a blockchain-based virtual power plant energy management platform, including distributed energy trading algorithm design and blockchain system implementation. Specifically, we modeled energy trading and network services for residential users with various loads, energy storage, and local renewables.

How can energy companies use cryptocurrency?

Energy companies can use cryptocurrency to facilitate energy production, distribution, and consumption transactions. One common application of blockchain technology is tokenizing energy assets, making energy units like kilowatt-hours as digital tokens on a blockchain. You can purchase, sell, or trade them on a cryptocurrency exchange.
