

How to use the hydraulic red punch energy storage device

What is hydraulic energy?

Hydraulic energy pertains to the power related to pressurized fluid, typically hydraulic fluid, used to accomplish machine motion. The pressure can be relatively static (such as reservoirs) or in motion through tubing or hoses. A good percentage of industrial equipment subject to OSHA 1910.147 will have at least one hydraulic Energy Source.

What is a hydraulic energy lockout device?

Flanges that allow a blank to be inserted. Hydraulic energy Lockout devices use positive means such as a lock and key to keep the associated energy isolation device in the safe position and prevent equipment energization. Typical hydraulic energy lockout devices are outlined in the Valve and Pneumatic page.

How do I verify the absence of hydraulic energy after lockout/tagout?

Verifying the absence of hydraulic energy after performing Lockout/Tagout can be done by attempting to operate the associated components and by observing the associated gages to ensure they indicate 0 (zero) pressure. Hydraulic energy isolation devices may vary in design and configuration.

What injuries are associated with hydraulic energy?

Injuries associated with hydraulic energy generally consist of the following: Eye injuries due to released pressure or blown debris. Skin abrasions/punctures when exposed to high pressure fluid stream. Unexpected machine motion due to hydraulic pressure acting on machine components.
