

Industrial park energy storage benefit project

Is a large industrial park considering integrating PV and Bess?

Conclusion This study examines the electricity consumption scenario of a large industrial park that is considering integrating PV and BESS. A MILP model with high temporal resolution is devised to conduct system configuration and operational co-optimization, with the aim of minimizing the average electricity cost.

How much does electricity cost in an industrial park?

With the techno-economic parameters shown in Table 1, assuming a maximum load of 10 MW and no upper limit on equipment capacities, the average cost of electricity in the industrial park after optimization using the proposed model is 0.5783 (CNY/kWh), which is 23.09 % lower than using only grid electricity (0.7522 CNY/kWh).

What factors affect the installation capacity of PV & Bess in industrial parks?

In general, the installation capacity of PV and BESS within industrial parks is constrained by internal and external factors including available site space and transformer capacity.

Are industrial parks a significant energy consumer in China?

As previously stated, industrial parks represent a significant energy consumer in China. There is a discernible correlation between the power demand load curves of the industrial park and the province.
