While many assume that all steel objects will attract magnets, the reality is a bit more nuanced. The magnetic behavior of steel depends on its composition and structure, which can influence ...

This is like a magnetic material -- all the atoms (Lego bricks) are aligned, and their individual magnetic fields add up to create a strong magnetic field for the whole block. Just like you can ...

This means that if a changing magnetic field is applied to a conductor, such as aluminium, the induced current will create its own magnetic ...

This is because magnetic metals have special particles that magnets can attract. So, if something doesn't stick to a magnet, it likely doesn't ...

The storage material is carefully insulated to keep the heat from escaping, and then channels of fluid or air are used to transfer the ...

Three types of metals interact with magnetic fields: ferromagnetic, paramagnetic and diamagnetic metals. Ferromagnetic metals are strongly attracted to magnets; the rest are ...
