How to implement the energy platform?

In order to implement the energy platform, there is significant work to develop enabling technologies such as energy storage, power electronics, and mathematical and computing tools. Control and optimization of a large number of devices and players to ensure system-level performance also requires a large and sustained effort.

Is energy storage a viable and distributed nature?

However, the viable and distributed nature requires large scale storage capacity built at all levels much like the capability to store data for telecommunication. All the generation and storage devices should be interconnected and managed by the energy platform. A large barrier is the high cost of energy storage at present time.

How to reduce energy storage cost?

There are two approaches to reduce the energy storage cost (Fig. 4a). One approach is to achieve much longer cycle life. Today's lithium iron phosphate (LFP) batteries are more stable and have longer cycle life than other transition metal oxide-based batteries.

Does the energy storage strategic plan address new policy actions?

This SRM does not address new policy actions, nor does it specify budgets and resources for future activities. This Energy Storage SRM responds to the Energy Storage Strategic Plan periodic update requirement of the Better Energy Storage Technology (BEST) section of the Energy Policy Act of 2020 (42 U.S.C. § 17232 (b) (5)).

What is energy storage & how does it work?

Unlike passive energy technologies, such as solar PV or energy efficiency upgrades, energy storage is a dynamic, flexible asset that needs to be precisely scheduled to deliver the most value. Energy storage can be operated in a variety of ways to deliver customized services based on a customer's unique needs.
