

Scope of responsibilities for energy storage equipment project management

Do energy storage systems need a safety assessment?

Safety Assessment: As more energy storage systems have become operational, new safety features have been mandated through various codes and standards, professional organizations, and learned best practices. The design and commissioning teams need to stay current so that required safety assessments can be performed during commissioning.

Which components of a battery energy storage system should be factory tested?

Ideally, the power electronic equipment, i.e., inverter, battery management system (BMS), site management system (SMS) and energy storage component (e.g., battery) will be factory tested together by the vendors. Figure 2. Elements of a battery energy storage system

Can energy storage be a single high-level resource?

This report summarizes over a decade of experience with energy storage deployment and operation into a single high-level resource to aid project team members, including technical staff, in determining leading practices for procuring and deploying BESSs.

What happens during the design phase of a metering system?

During the design phase, the system must be designed so that all necessary tests can be performed with appropriate metering, data point identification and location, and access to the data. During this phase, the commissioning team develops the plan and confirms the change process.

Do energy storage subsystems have to pass a factory witness test?

Each subsystem must pass a factory witness test (FWT) before shipping. (Note: The system owner reserves the right to be present for the factory witness test.) This is the first real step of the commissioning process--which occurs even before the energy storage subsystems (e.g., power conditioning equipment and battery) are delivered to the site.
