

What is the shared energy storage business model?

Fig. 1 shows the shared energy storage business model between the DCC and the SIESS. There are four kinds of energy flow in a DC, including electricity flow, heat flow, gas flow, and cooling flow. Wind turbines (WTs) are installed in DCs to provide supplementary electricity sources.

Is shared energy storage a viable business model for data center clusters?

As mentioned above, there is a lot of research studying the shared storage business model [39,40]. However, to the best of our knowledge, there is little research considering the economic benefits of the integrated shared energy storage business on the data center cluster (DCC).

What is shared Energy Storage (SES)?

As a new paradigm of energy storage industry under the sharing economy, shared energy storage (SES) can effectively improve the comprehensive regulation ability and safety of the new energy power system.

How can shared energy storage services be optimized?

A multi-agent model for distributed shared energy storage services is proposed. A tri-level model is designed for optimizing shared energy storage allocation. A hybrid solution combining analytical and heuristic methods is developed. A comparative analysis reveals shared energy storage's features and advantages.

Why is the decision-making process important in shared energy storage?

The decision-making process between different agents must be considered during configuration and operation, making the business model more complex and better suited to the market-oriented operation mode of the power system. Shared energy storage involves multiple agents, objectives, and constraints.

What are the energy storage configuration results for case 2?

Table 7 displays the energy storage configuration results for Case 2 where the energy storage's maximum power is 3470 kW, and its maximum capacity is 15,220 kWh. Furthermore, it is noted that the investment expense of energy storage in Case 2 is 59.67% higher compared to that of Case 1.
