How is a boiler insulated and casing inspected?

Prior to applying the boiler insulation and casing, the boiler was subject to an inner casing air test. The boiler was pressurized to 10 inches of water and subject to the following inspection under pressure: Soap and Bubble Test: Acceptance Criteria, no continuous bubble formation.

How should a boiler be stored?

With that not being feasible, the following procedure is suggested and recommended to lay-up the boiler and equipment for storage: Provide photographs of the boiler from all angles and views, as it exists, before protection is applied. Provide a written report of any unusual or adverse conditions that may be noted to exist.

Who decides if a boiler is protected?

The actual procedure is the complete responsibility of the customer, who shall determine the extent of the protection. It is necessary to provide on-going inspection of the equipment to determine if additional efforts will be needed. The warranty for the boiler and all accessories becomes effective on day of shipment.

How should a boiler be operated in steady state conditions?

The boiler shall be operated in steady state conditions in accordance with Table 1. During this period, measurements shall be taken from the newly installed and calibrated plant instrumentation system. A portable combustion analyzer shall be used to determine the products of combustion.

How long should a boiler vent be open?

Leave drum vent open until steam blows out at a steady rate, at about 5 psig pressure, to vent air from the boiler and reduce corrosion possibilities. Close the vent and continue firing at the minimum rate until 30 psi pressure is reached, at which point the burner should be shut off for 15 minutes to allow the temperature to equalize.

What tests were performed on a gas boiler?

The boiler was pressurized to 10 inches of water and subject to the following inspection under pressure: Soap and Bubble Test: Acceptance Criteria, no continuous bubble formation. Pressure Decay Test: Acceptance Criteria, less than 5 in H<sub>2</sub>O loss in 10 minutes. The Air Casing Test was performed with acceptable results.
