What happens to excess solar power when batteries are full?

When solar batteries are full, you need to find a way to use the excess power, or it will go to waste. There are a number of ways to utilize excess power. However, net metering is not available everywhere in the US, and then your best option is storing your solar energy in battery form.

How is excess solar energy handled?

When solar-powered batteries are full, any excess energy is wasted if it isn't redirected somewhere else. A switch is usually installed either to direct the excess power to auxiliary sources or to simply ensure that the excess charge doesn't damage the battery.

How do solar panels handle excess energy?

They handle the excess energy in the following ways: This is the most direct way of dealing with the excess energy. When the battery is full, the excess power is directed back into the solar panels, resulting in a temporary increase in voltage.

What happens to excess solar power when net metering isn't available?

When net metering is not available, your best option is storing your solar energy in battery form. Net metering allows you to use the excess power produced by your solar panels when you are outside of sunlight hours.

What happens to extra energy when batteries are full?

When batteries are full, the simplest way to use the extra energy you generate is just to have your system connected to the grid. This means that instead of storing extra energy you generate in a battery, you'll simply send it off to the grid. Your power company will usually pay you a small amount for the energy you export.

What is an opportunity load in solar power?

In solar power systems, the extra energy produced after the battery is fully charged and the inverter's load requirement is met is known as an opportunity load.
